

## Abstract

### Method and Cleaning Fluid for the Wet Cleaning of Objects

For the wet cleaning of objects, a cleaning fluid of water and an organic  
5 cleaning agent is used, whereby the cleaning fluid and the water form a  
solution within certain concentration and temperature ranges, and  
outside of these ranges, have a miscibility gap. The cleaning fluid is  
present for the wet cleaning in the state of the miscibility gap and  
contains the solvent in a concentration which at the temperature  
10 prevailing at the wet cleaning, lies above that concentration at which,  
starting from water, upon addition of the solvent, the miscibility gap  
sets in.
